Bringing Your Content to Life in 3D

Screenshots:

Problem statement:

Today, the method of receiving information is textual, long, uninviting, outdated and boring.

This situation can cause a lack of interest in business' information and content about the business' product. It can cause losing customers and not attracting new customers.

That's why, A need arose- finding a way to make content accessible in a more attractive way, inviting and interesting.

Solution:

Through the development of the application, it is possible to provide content in a visual sound way.

Using a mobile phone (QR scan), the user will be able to get the information by a character that looks more inviting and attracts attention more than a written text .
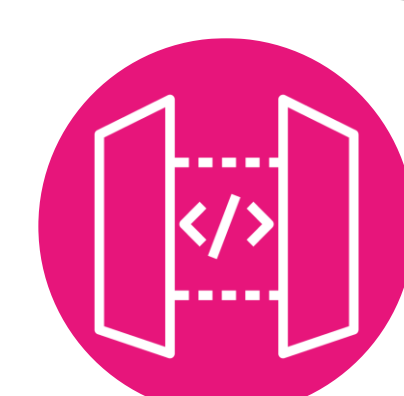

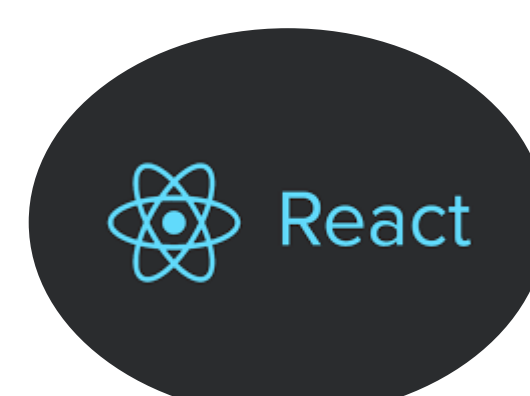

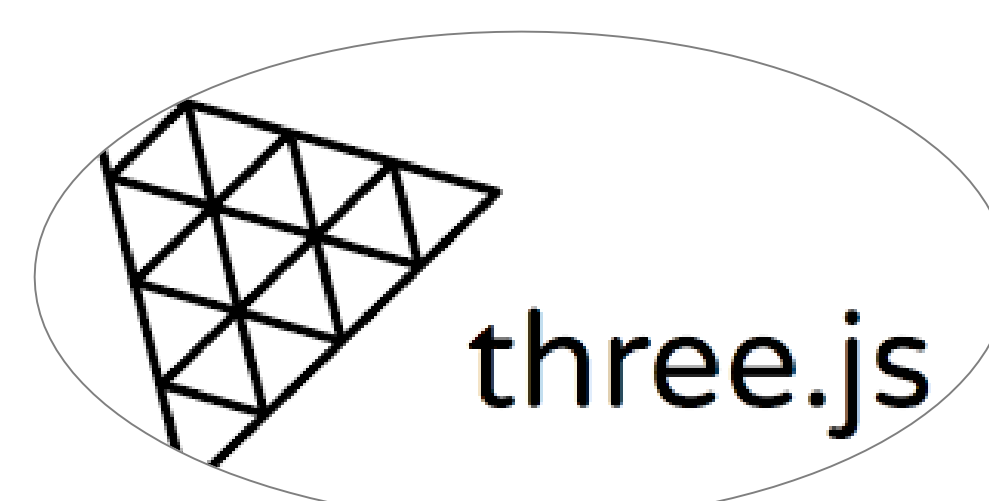

Also, as part of the application we created a platform for the flow of information about the subject under investigation in an easy, fast and interesting way.

Target Audience:

Business owners or any person who wants to present content in a more attractive and selling way.

Call to Action:

As a business owner: register to our website and get the option to customize the 3D environment by choosing a character and background that fits the nature of the business. After that, insert the wanted text and the character will read it .

As a User: scan the QR, then listen and watch the content in a more interesting and visual way.
